ClinicalKey AI: The Product

ClinicalKey AI is a clinical decision support solution that aids clinicians by combining trusted, evidence-based clinical content with generative AI to transform complexity into clarity.

ClinicalKey AI (**Figs. 1, 2**):

- Is optimized for natural-language queries
- Evaluates multiple evidenced-based content sources, which are updated daily, to summarize a response
- Considers patient context, such as comorbidities and current medications, when prompted
- Allows users to ask follow-up questions
- Includes references with linked citations to supporting published evidence
- Enables users to earn CME with each clinical response
- Provides HIPAA protection to ensure secure, responsible data use within the workflow

Success strategies

With **ClinicalKey AI**, you'll connect your clinicians to a platform that can empower them to make informed, confident decisions by providing fast, reliable, and relevant clinical knowledge.

Communication strategy

- Develop a clear plan of communication leading up to the roll-out of ClinicalKey AI.
- Leverage Elsevier-branded templates and awareness tools for fueling promotion, adoption, and trust.

Engagement strategy

- Identify product champions to share ClinicalKey AI's benefits and best practices to department colleagues.
- Participate in ClinicalKey AI features spotlight sessions with the Elsevier Customer Success team.

Change management strategy

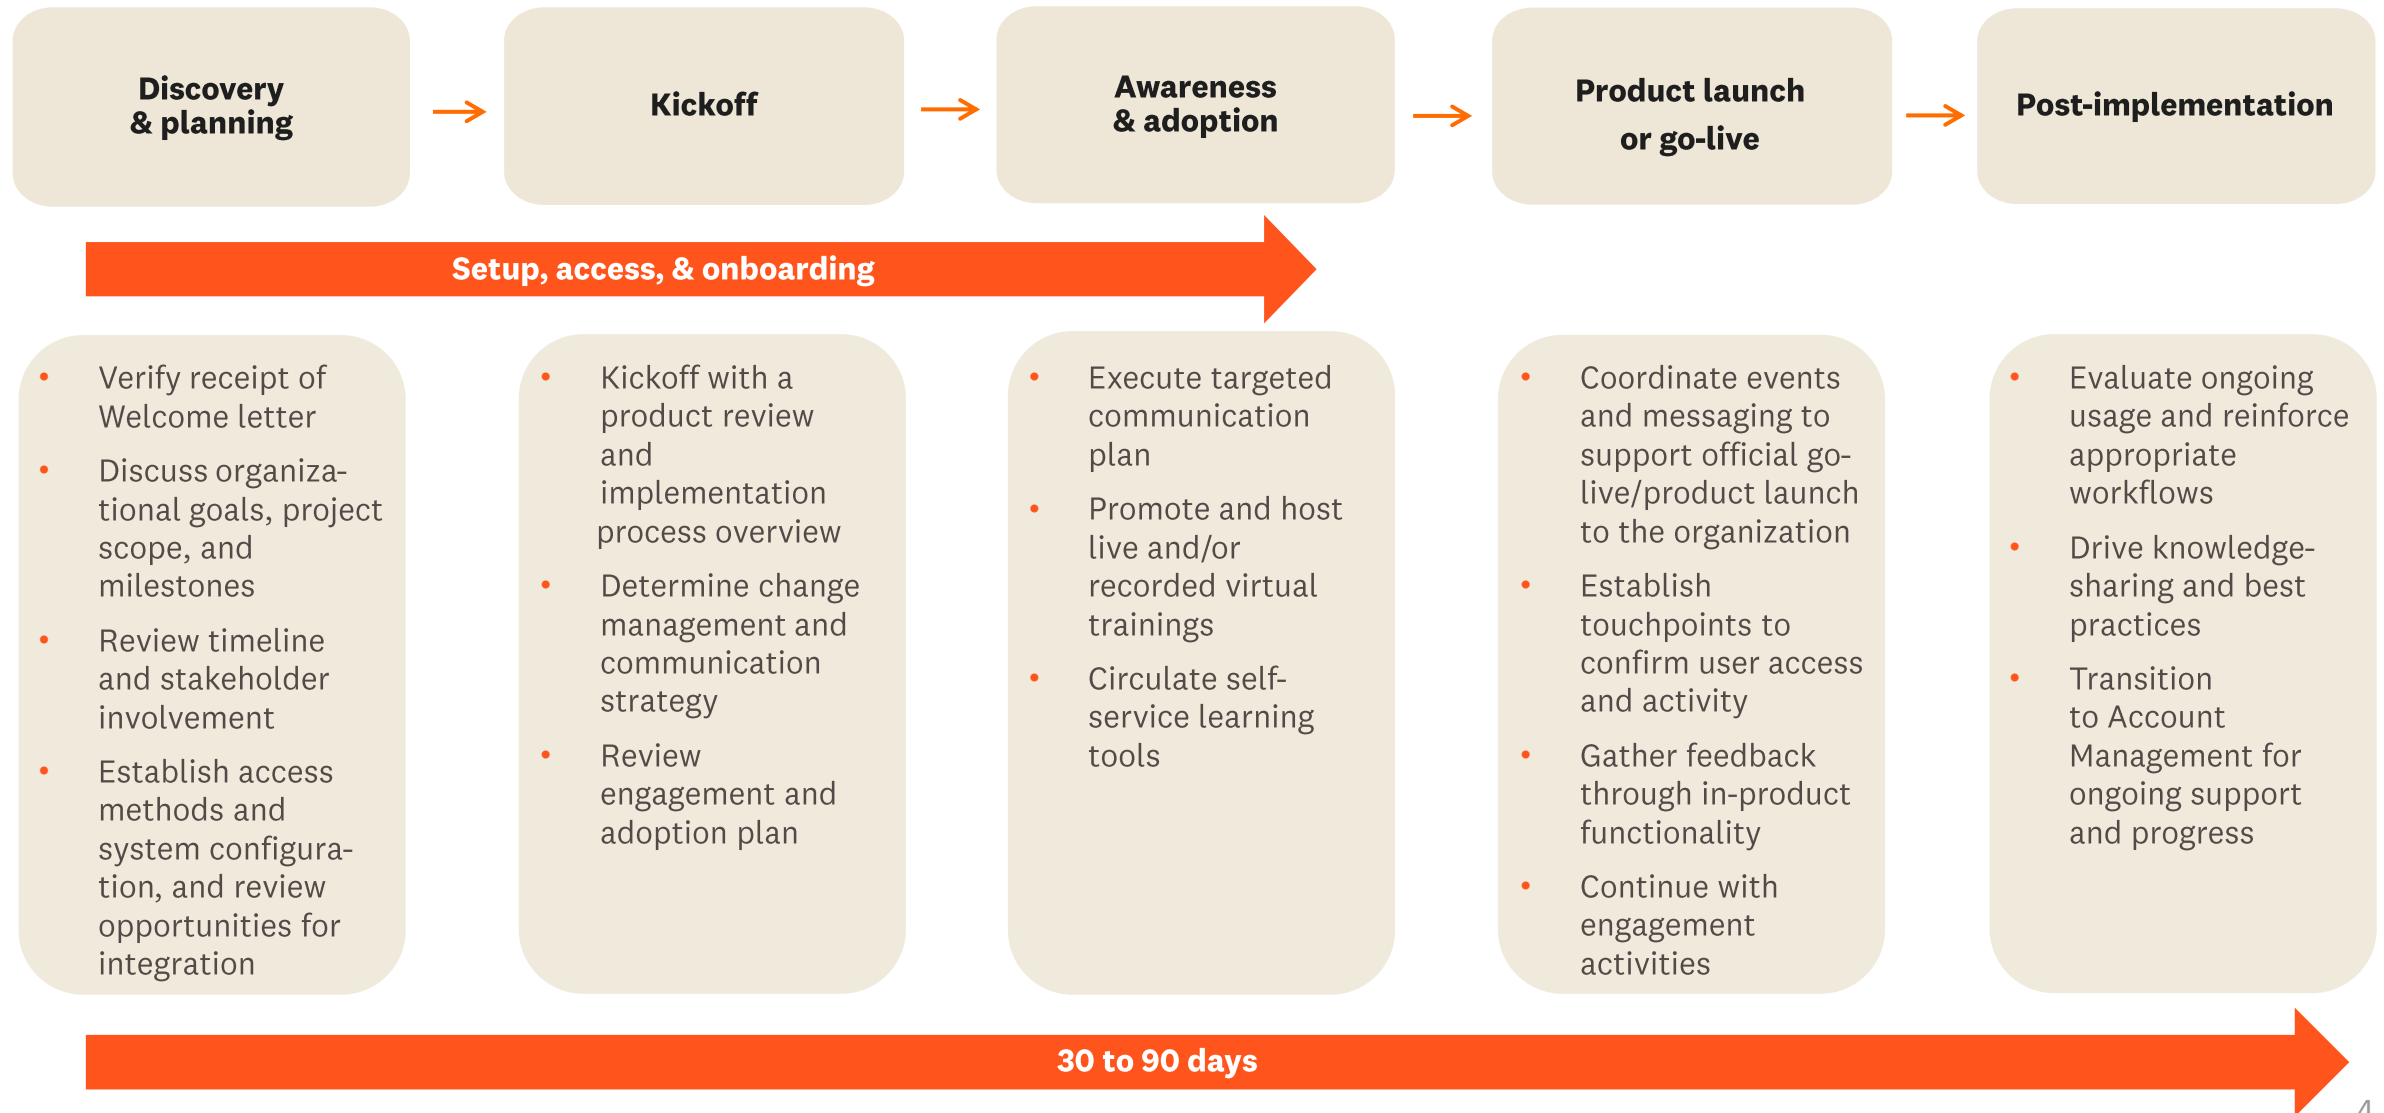

- Work with organizational leaders on optimizing the use of ClinicalKey AI and ClinicalKey at the point of care.
- Define goals, timeline, and touchpoints for seamless product(s) transition.

Launch strategy

- Partner with your Elsevier team to execute a comprehensive launch plan.
- Schedule open office hours or other clinician forums to answer product questions and gather feedback.

Implementation milestones

Meetings and key events

The events listed below function as important touchpoints throughout your ClinicalKey AI implementation.

Welcome and planning call

- For clinical and project stakeholders
- A product overview, review of access methods, confirmation of access, and planning discussion for establishing timelines and outcomes

Kickoff meeting

- For clinical and project stakeholders
- Project objectives and engagement planning
- A live demo of the application including best practices

Training sessions

- For clinical champions and clinician end users of the product
- A live demo of the application including best practices, reliability, and content reference features

Project meetings

- For project stakeholders
- A weekly session to track progress and complete project tasks
- Reviewing the user experience and feedback

Recommended partners

Executive Sponsor

- The Executive Sponsor is a senior executive who functions as a product champion. They support the project from a strategic perspective and consider how it aligns with organizational objectives.
- **Participates in:** Kickoff/planning call, go-live

Project Manager/Project Lead

- The Project Lead is your organization's primary point of contact for leading the implementation. They help shape the scope and timelines of the project based on the needs and strategy of the organization.
- **Participates in:** All implementation activities

Project stakeholder

- Project stakeholders are members of your organization who represent the various operational and clinical teams' values and needs to ensure overall alignment.
- **Participates in:** Training, go-live

Superuser

- Superusers are key leads who advocate for the use of the product and offer support during the go-live phase of the project.
- **Participates In:** Training, go-live

Physician champion

- Physician champions are a core group of physicians who can advocate for ClinicalKey AI's value and help colleagues adopt best practices.
- **Participates in:** Kickoff/planning call, training, go-live

Clinical Informaticist

- Clinical Informatics will assist in the setup and configuration of ClinicalKey AI and support and inform system adoption issues.
- **Participates in:** Kickoff/planning call, system configuration, go-live

Librarian

- These administrators advise of content availability and answer any product questions.
- **Participates in:** All implementation activities

IT Resource/Clinical Applications

- IT Resource ensures security and access requirements are met by performing functions such as safelisting domains, ensuring successful access methods, creating desktop icons, and more.
- **Participate in:** System configuration, go-live

End user

- General users of ClinicalKey AI may include physicians, pharmacists, advanced practitioners, nurses, researchers, residents, and academic departments.
- **Participates in:** Training

What is SAML SSO?

SAML SSO (Security Assertion Markup Language Single–Sign On) is a way for users to access multiple websites or applications without having to remember separate usernames and passwords for each one (**Fig. 3**).

- It works like a master key that allows users to log into different websites or applications using one set of credentials.
- It relies on you validating that your users are who they say they are.

Benefits of SSO

- Secure means of access
- One set of credentials for users
- You are in control of users
- Onsite and remote access
- Allows for personalization
- Privacy preserving

Setup options

1. Bilateral: Direct metadata exchange with your systems
2. Multi-lateral:* Metadata exchange with your systems via federations, e.g., InCommon

*Not available yet
